# SONY

Diagonal 6.4 mm (Type 1/2.8) CMOS Image Sensor with Square Pixel for Color Cameras

# **IMX222LQJ-C**

### **Description**

The IMX222LQJ-C is a diagonal 6.4 mm (Type 1/2.8) CMOS active pixel type image sensor with a square pixel array and approximately 2.43 M effective pixels. This chip operates with analog 2.7 V, digital 1.2 V and interface 1.8 V triple power supplies. High sensitivity, low dark current and no smear are achieved through the adoption of R, G and B primary color pigment mosaic filters. This chip features an electronic shutter with variable integration time. (Applications: Surveillance cameras)

#### **Features**

- ◆ CMOS active pixel type dots
- ◆ Input clock frequency: 54 MHz/37.125 MHz
- ◆ Readout mode

All-pixel scan mode

HD1080 p mode (when INCK = 37.125 MHz)

HD720 p mode (when INCK = 37.125 MHz)

Window cropping mode

Horizontal vertical 2 × 2 binning mode

Vertical 1/2 subsampling mode

- ◆ Variable-speed shutter function (Minimum unit: One horizontal sync signal period (1XHS))
- ◆ H driver, V driver and serial communication circuit on chip
- ♦ CDS/PGA on chip

0 dB to 24 dB: Analog Gain 24 dB (step pitch 0.3 dB)

24.3 dB to 42 dB: Analog Gain 24 dB + Digital Gain 0.3 to 18 dB (step pitch 0.3 dB)

- ◆ 10-bit/12-bit A/D converter on-chip
- Output method switchable
  - ◆ CMOS logic parallel SDR/DDR output Data-Clock output
  - ◆ Low voltage LVDS serial 1ch/2ch output Data-Strobe output
- ◆R, G, B primary color pigment mosaic filters on chip
- ◆ Recommended lens F value: 2.8 or more (close side)
- ◆ Recommended exit pupil distance: -30 mm to -∞

\* "Exmor" is a trademark of Sony Corporation. The "Exmor" is a version of Sony's high performance CMOS image sensor with high-speed processing, low noise and low power dissipation by using column-parallel A/D conversion.

Sony reserves the right to change products and specifications without prior notice.

This information does not convey any license by any implication or otherwise under any patents or other right.

Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

#### **Device Structure**

◆ CMOS image sensor

◆ Image size Diagonal 6.4 mm (Type 1/2.8)

◆ Total number of pixels

All-pixel scan: 2000 (H)  $\times$  1241 (V) approx. 2.48 M pixels HD1080 p: 2000 (H)  $\times$  1121 (V) approx. 2.24 M pixels

◆ Number of effective pixels

All-pixel scan: 1984 (H)  $\times$  1225 (V) approx. 2.43 M pixels HD1080 p: 1984 (H)  $\times$  1105 (V) approx. 2.19 M pixels

◆ Number of active pixels

All-pixel scan: 1936 (H)  $\times$  1217 (V) approx. 2.36 M pixels HD1080 p: 1936 (H)  $\times$  1097 (V) approx. 2.12 M pixels

◆ Number of recommended recording pixels

All-pixel scan: 1920 (H)  $\times$  1200 (V) approx. 2.30 M pixels HD1080 p: 1920 (H)  $\times$  1080 (V) approx. 2.07 M pixels

◆ Chip size

7.60 mm (H) × 5.80 mm (V)

◆ Unit cell size

 $2.8 \mu m (H) \times 2.8 \mu m (V)$ 

◆ Optical black

Horizontal (H) direction: Front 16 pixels, rear 0 pixels
Vertical (V) direction: Front 16 pixels, rear 0 pixels

**♦** Dummy

Horizontal (H) direction: Front 0 pixels, rear 0 pixels
Vertical (V) direction: Front 7 pixels, rear 0 pixels

◆ Substrate material

Silicon

Output voltage (digital)	Vo	-0.1 to OVpp+0.1	V

#### **USE RESTRICTION NOTICE**

This USE RESTRICTION NOTICE ("Notice") is for customers who are considering or currently using the image sensor products ("Products") set forth in this specifications book. Sony Corporation ("Sony") may, at any time, modify this Notice which will be available to you in the latest specifications book for the Products. You should abide by the latest version of this Notice. If a Sony subsidiary or distributor has its own use restriction notice on the Products, such a use restriction notice will additionally apply between you and the subsidiary or distributor. You should consult a sales representative of the subsidiary or distributor of Sony on such a use restriction notice when you consider using the Products.

#### **Use Restrictions**

- The Products are intended for incorporation into such general electronic equipment as office products, communication products, measurement products, and home electronics products in accordance with the terms and conditions set forth in this specifications book and otherwise notified by Sony from time to time.
- You should not use the Products for critical applications which may pose a life- or injury- threatening
  risk or are highly likely to cause significant property damage in the event of failure of the Products. You
  should consult your sales representative beforehand when you consider using the Products for such
  critical applications. In addition, you should not use the Products in weapon or military equipment.
- Sony disclaims and does not assume any liability and damages arising out of misuse, improper use, modification, use of the Products for the above-mentioned critical applications, weapon and military equipment, or any deviation from the requirements set forth in this specifications book.

#### **Design for Safety**

 Sony is making continuous efforts to further improve the quality and reliability of the Products; however, failure of a certain percentage of the Products is inevitable. Therefore, you should take sufficient care to ensure the safe design of your products such as component redundancy, anti-conflagration features, and features to prevent mis-operation in order to avoid accidents resulting in injury or death, fire or other social damage as a result of such failure.

#### **Export Control**

• If the Products are controlled items under the export control laws or regulations of various countries, approval may be required for the export of the Products under the said laws or regulations. You should be responsible for compliance with the said laws or regulations.

#### No License Implied

• The technical information shown in this specifications book is for your reference purposes only. The availability of this specifications book shall not be construed as giving any indication that Sony and its licensors will license any intellectual property rights in such information by any implication or otherwise. Sony will not assume responsibility for any problems in connection with your use of such information or for any infringement of third-party rights due to the same. It is therefore your sole legal and financial responsibility to resolve any such problems and infringement.

#### **Governing Law**

This Notice shall be governed by and construed in accordance with the laws of Japan, without reference
to principles of conflict of laws or choice of laws. All controversies and disputes arising out of or relating
to this Notice shall be submitted to the exclusive jurisdiction of the Tokyo District Court in Japan as the
court of first instance.

#### **Other Applicable Terms and Conditions**

The terms and conditions in the Sony additional specifications, which will be made available to you when
you order the Products, shall also be applicable to your use of the Products as well as to this
specifications book. You should review those terms and conditions when you consider purchasing
and/or using the Products.

XCE High level pulse width	t <sub>WLXCE</sub>	20	_	_	ns
SDI input setup time	t <sub>SUSDI</sub>	10	_	_	ns
SDI input hold time	t <sub>HDSDI</sub>	10	_	_	ns
SDO output setup time	t <sub>SUSDO</sub>			25	ns
SDO output hold time	t <sub>HDSDO</sub>	0	_	_	ns

<sup>\*</sup>When INCK = 54MHz only. When changing INCK from 54MHz, the maximum value is INCK / 2.

### e) DCK and DO Output Characteristics (Parallel CMOS Output Mode)

e-1) SDR Output (FRSEL = 1d)

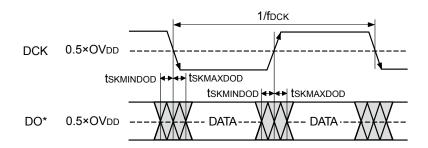

(Output load capacitance: 20 pF)

Item	Symbol	Min.	Тур.	Max.	Unit
DCK clock frequency	f <sub>DCK</sub>	_	INCK	_	MHz
DCK clock duty	_	40	50	60	%
Maximum skew between DCK and DO*	t <sub>SKMAXDOS</sub>	_	_	2	ns
Minimum skew between DCK and DO*	t <sub>SKMINDOS</sub>	_	_	2	ns

The DCK frequency is the same as that of INCK when the SDR setting and the FRSEL is set to 1. It is 54 MHz for all-pixel mode or other modes and 37.125 MHz for HD1080p/HD720p mode.

# e-2) DDR Output In-phase Output (DCKDLY = 0d) (FRSEL = 1d)

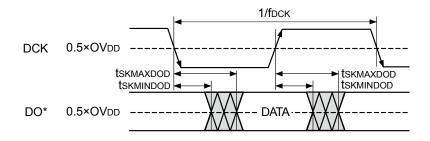

(Output load capacitance: 20 pF)

Item	Symbol	Min.	Тур.	Max.	Unit
DCK clock frequency	f <sub>DCK</sub>	_	INCK/2	_	MHz
DCK clock duty	_	40	50	60	%
Maximum skew between DCK and DO*	t <sub>SKMAXDOD</sub>	_	_	2	ns
Minimum skew between DCK and DO*	t <sub>SKMINDOD</sub>	_	_	2	ns

The DCK frequency is the same as that of INCK/2 when the DDR setting and the FRSEL is set to 1. It is 27 MHz for all-pixel mode or other modes and 18.5625 MHz for HD1080p/HD720p mode.

# e-3) DDR Output 90° Phase Delay Output (DCKDLY = 1d) (FRSEL = 1d)

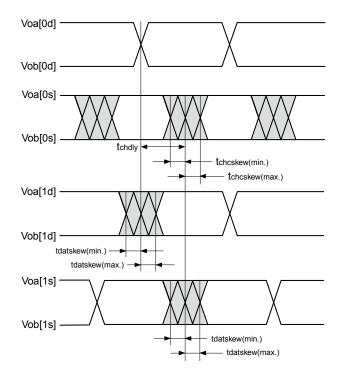

# (Output load capacitance: 20 pF)

Item	Symbol	Min.	Тур.	Max.	Unit
DCK clock frequency	f <sub>DCK</sub>	_	INCK/2	_	MHz
DCK clock duty	_	40	50	60	%
Maximum skew between DCK and DO*	tskmaxdod	_	_	6.6	ns
Minimum skew between DCK and DO*	t <sub>SKMINDOD</sub>	3.2			ns

### SONY

### f) DATA/STROBE Output Characteristics (Serial LVDS Output Mode)

#### Note)

Voa/Vob: Differential signals which are paired DATAM0 / DATAP0
 DATAM1 / DATAP1
 STRBM0 / STRBP0
 STRBM1 / STRBP1

- Characteristics in [ ] indicate the followings
   Figure (0/1): Output channel
   Alphabet (d/s): d: Data
   s: Strobe
- Tchcskew uses the cross point of Voa and Vob as a reference.
   The skew of STRB signal is set with the DATA clock as a reference in the diagram.

Item	Symbol	Min.	Тур.	Max.	Unit
Skew between differential signal clocks	t <sub>chcskew</sub>	-400	_	400	ps
Skew between different signals	t <sub>datskew</sub>	-250	_	250	ps
Difference between data and strobe edges <sup>*1</sup>	t <sub>chdly</sub>	1	_	_	bit

The offset of data output waveform edge and strobe output waveform are represented.

The diagram above indicates the difference from data output edge to strobe output edge.

Line crawl R		Lcr	_	_	6	%	7	
Line crawl B		Lcb			6	%	7	_
Lag		Lag			0.5	%	8	

Conversion is executed with 1 digit = 0.890 mV for 10-bit output and 1 digit = 0.2224 mV for 12-bit output.

# **Zone Definition of Video Signal Shading**

The video signal shading is the measured value in the wafer status (including color filter) and does not include the seal glass characteristics.

<sup>&</sup>lt;sup>\*3</sup> See the Zone Definition of Video Signal Shading (diagram below) for Zone.

#### **Image Sensor Characteristics Measurement Method**

#### **Measurement Conditions**

In the following measurements, the device drive conditions are at the typical values of the bias conditions and clock voltage conditions.

In the following measurements, spot pixels are excluded and, unless otherwise specified, the optical black (OB) level is used as the reference for the signal output, which is taken as the value of the Gr/Gb channel signal output or the R/B channel signal output of the measurement system.

### **Color Coding of this Image Sensor and Readout**

The primary color filters of this image sensor are arranged in the layout shown in the figure below. Gr and Gb represent the G signal on the same line as the R and B signals, respectively. The Gb signal and B signal lines and the R signal and Gr signal lines are output successively.

Gb	В	Gb	В
R	Gr	R	Gr
Gb	В	Gb	В
R	Gr	R	Gr

Color Coding Diagram

#### **Definition of standard imaging conditions**

#### ◆ Standard imaging condition I:

Use a pattern box (luminance:  $706 \text{ cd/m}^2$ , color temperature of 3200 K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0 mm) as an IR cut filter and image at F5.6. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.

#### ◆ Standard imaging condition II:

Image a light source (color temperature of 3200 K) with a uniformity of brightness within 2 % at all angles. Use a testing standard lens with CM500S (t = 1.0 mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

#### ◆ Standard imaging condition III:

Image a light source (color temperature of 3200 K) with a uniformity of brightness within 2 % at all angles. Use a testing standard lens (exit pupil distance -30 mm) with CM500S (t = 1.0 mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

#### **Measurement Method**

#### 1. Sensitivity

Set the measurement condition to the standard imaging condition I. After setting the electronic shutter mode with a shutter speed of 1/100 s, measure the Gr and Gb signal outputs (VGr, VGb) at the center of the screen, and substitute the values into the following formula.

$$Sg = (VGr + VGb) / 2 \times 100 / 30 [mV]$$

#### Sensitivity ratio

Set the measurement condition to the standard imaging condition II. After adjusting the average value of the Gr and Gb signal outputs to 510 mV, measure the R signal output (VR [mV]), the Gr and Gb signal outputs (VGr, VGb [mV]) and the B signal output (VB [mV]) at the center of the screen in frame readout mode, and substitute the values into the following formulas.

#### 3. Saturation signal

Set the measurement condition to the standard imaging condition II. After adjusting the luminous intensity to 20 times the intensity with the average value of the Gr and Gb signal outputs, 510 mV, measure the average values of the Gr, Gb, R and B signal outputs.

#### 4. Video signal shading

Set the measurement condition to the standard imaging condition III. With the lens diaphragm at F2.8, adjust the luminous intensity so that the average value of the Gr and Gb signal outputs is 510 mV. Then measure the maximum value (Gmax [mV]) and the minimum value (Gmin [mV]) of the Gr and Gb signal outputs, and substitute the values into the following formula.

$$SH = (Gmax - Gmin) / 510 \times 100 [\%]$$

#### 5. Dark signal

With the device ambient temperature of 60 °C and the device in the light-obstructed state, divide the output difference between 1/30 s integration and 1/300 s integration by 0.9, and calculate the signal output converted to 1/30 s integration. Measure the average value of this output (Vdt [mV]).

#### 6. Dark signal shading

After the measurement item 5, measure the maximum value (Vdmax [mV]) and the minimum value (Vdmin [mV]) of the dark signal output, and substitute the values into the following formula.

$$\Delta Vdt = Vdmax - Vdmin [mV]$$

#### 7. Line crawl

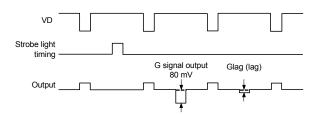

Set the measurement condition to the standard imaging condition II. After adjusting the average value of the Gr signal output to 510 mV, insert R and B filters and measure the difference between G signal lines ( $\Delta$ Glr,  $\Delta$ Glb[mV]) as well as the average values of the G signal outputs (Gar, Gab). Substitute the values into the following formula.

Lci = 
$$(\Delta Gli/Gai) \times 100 [\%] (i = r, b)$$

#### 8. Lag

Adjust the G signal output value generated by strobe light to 80 mV. After setting the strobe light so that it strobes with the following timing, measure the residual signal (Glag), and substitute the value into the following formula.

$$Lag = (Glag / 80) \times 100 [\%]$$

### **Setting Registers with Serial Communication**

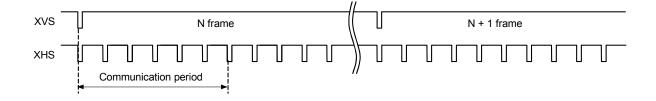

#### **Description of Setting Registers**

This sensor can write and read the setting values of the various registers shown in the Register Map by 4-wire serial communication. See the Register Map for the addresses and setting values to be set. The serial data input order is LSB-first transfer. The table below shows the various data types and descriptions.

Туре	Description
ChipID	02h: Write to the CID = 02h register 03h: Write to the CID = 03h register 82h: Read from the CID = 02h register 83h: Read from the CID = 03h register
Address	Designate the address according to the Register Map. When using a communication method that designates continuous addresses, the address is automatically incremented from the previously transmitted address.
Data	Input the setting values according to the Register Map.

#### **Register Communication Timing**

Perform register communication within the 6H period after the falling edge of XVS. Register setting values are reflected at the following timing. When communication is performed during the communication period shown in the figure below, items noted as "V" in the "Reflection timing" column of the Register Map are output in the state with the setting value reflected in the N frame. However, note that although the integration time setting is reflected in the N frame, it is reflected to shutter control after N frame readout, so the setting value is reflected to the output in the N + 1 frame. Items that are reflected instantly are reflected at the timing when communication is performed.

Register Reflection Timing

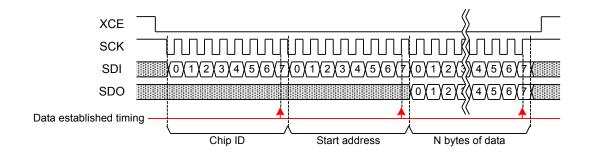

#### **Register Write and Read**

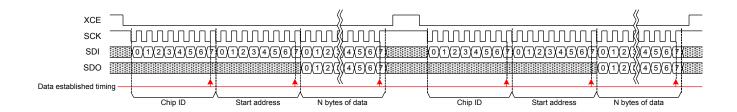

- Follow the communication procedure below when writing registers.
  - (1) Set XCE Low to enable the chip's communication function. Serial data input is executed using SCK and SDI.
  - (2) Transmit data in sync with SCK 1 bit at a time from the LSB using SDI. Transfer SDI in sync with the falling edge of SCK. (The data is loaded at the rising edge of SCK.)
  - (3) Input the Chip ID (CID = 02h or 03h) to the first byte. If the Chip ID differs, subsequent data is ignored.
  - (4) Input the start address to the second byte. The address is automatically incremented.
  - (5) Input the data to the third and subsequent bytes. The data in the third byte is written to the register address designated by the second byte, and the register address is automatically incremented thereafter when writing the data for the fourth and subsequent bytes. Normal register data is loaded to the inside of the sensor and established in 8-bit units.
  - (6) The register values starting from the register address designated by the second byte are output from the SDO pin. The register values before the write operation are output. The actual register values are the input data.
  - (7) Set XCE High to end communication.
- Follow the communication procedure below when reading registers.
  - Set XCE Low to enable the chip's communication function.
     Serial data input is executed using SCK and SDI.
  - (2) Transmit data in sync with SCK 1 bit at a time from the LSB using SDI. Transfer SDI in sync with the falling edge of SCK. (The data is loaded at the rising edge of SCK.)
  - (3) Input Chip ID (CID = 82h or 83h) to the first byte. If the Chip ID differs, subsequent data is ignored.
  - (4) Input the start address to the second byte. The address is automatically incremented.
  - (5) Input data to the third and subsequent bytes. Input dummy data in order to read the registers. The dummy data is not written to the registers. To read continuous data, input the necessary number of bytes of dummy data.
  - (6) The register values starting from the register address designated by the second byte are output from the SDO pin. The input data is not written, so the actual register values are output.
  - (7) Set XCE High to end communication.
- Note) Even when changing register setting values during imaging, communication should finish within the 6H communication period. When writing data to multiple registers with discontinuous addresses, access to undesired registers can be avoided by repeating the above procedure multiple times. The figures on the following page show examples of transmission.

### ChipID: 03

Address	Bit	Register name	Description		t value reset	Reflection timing
Address	DIL	Register flame	Description	By register	By address	
17h	[7:0]		Fixed to "0Dh" *2.	4Dh	4Dh	Immediately

<sup>&</sup>lt;sup>\*1</sup> The STANDBY (Address 00h [0]) register is reflected at the following timings.

<sup>•</sup>When canceling standby mode: Reflected immediately

<sup>•</sup>When entering standby mode: Reflected immediately after the end of the frame during which the setting was made

The values must be changed from the default values, so initial setting after reset is required after power-on. Subsequent setting by communication is not needed unless the power is turned Off or the system is reset.

<sup>&</sup>quot;V" in the "Reflection timing" column indicates that the setting value is reflected at the falling edge of the next XVS after the register communication is performed.

Do not perform communication to addresses not listed in the Register Map. Doing so may result in malfunction. However, other registers that require communication to addresses not listed above may be added, so addresses up to FFh should be supported for both CID = 02h and 03h.

## **Readout Drive Mode**

The table below lists the operating modes available with this sensor.

				Imaging co	nditions			
Drive mode	INCK	Frame	Output Resolution	1	nber of ve pixels	Data w	ridth <sup>*1</sup>	1H
	[MHz]	rate [frame/s]	[bit]	H [pixels]	V [lines]	H [INCK]	V [lines]	period [µs]

2 × 2 binning	54	14.985	10/12 <sup>*2</sup>	992	640	4400	010	81.48
readout	<del>34</del>	29.97	10/12 <sup>*2</sup>	992	612	2200	819	40.74
Vertical 1/2	54	29.97	10/12	1984	612	2200		40.74
subsampling	54	59.94	10	1904	613	1100	819	20.37

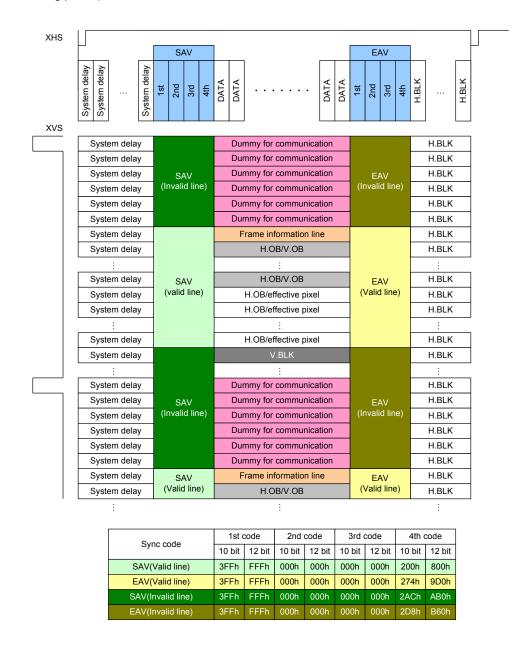

The data width indicates the output sync signal period in master mode. In slave mode the data width is the input XVS and XHS clock interval.

<sup>&</sup>lt;sup>\*2</sup> In 2 × 2 binning readout mode, the pixel signals are converted to 10 bits and digitally added. The output gradation can be selected from 10 bits or 12 bits.

#### Sync Code (Parallel CMOS Output Mode)

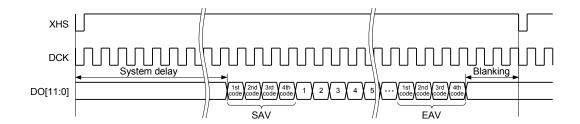

The sync code is added immediately before and after "dummy signal + OB signal + effective pixel data" and then output. The sync code is output in order of 1st, 2nd, 3rd and 4th. The fixed value is output for 1st to 3rd. (BLK: Blanking period)

Sync Code Output Timing (Parallel CMOS Output)

## Sync Code Output Timing (Parallel CMOS Output Mode)

The sensor output signal passes through the internal circuits and is output with a latency time (system delay) relative to the horizontal sync signal. This system delay value is undefined for each line, so refer to the sync codes output from the sensor and perform synchronization.

**SONY** IMX222LQJ-C

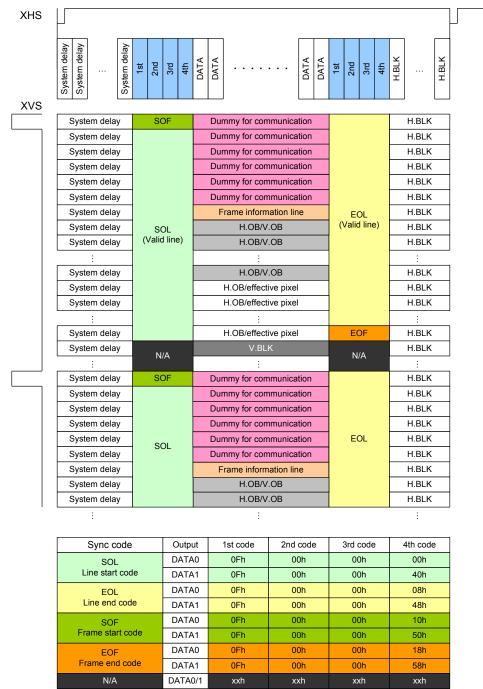

#### Sync Code (Serial LVDS Output Mode)

The sync code is added immediately before and after "dummy signal + OB signal + effective pixel data" and then output. The sync code is output in order of 1st, 2nd, 3rd and 4th. The fixed value is output for 1st to 3rd. (BLK: Blanking period)

\* N/A : The minimum sensor output value is output. (Not 00h)

Sync Code 1 Output Timing (Serial LVDS Output)

\* N/A : The minimum sensor output value is output. (Not 00h)

Sync Code 2 Output Timing (Serial LVDS Output)

### Sync Code Output Timing (Serial LVDS Output Mode)

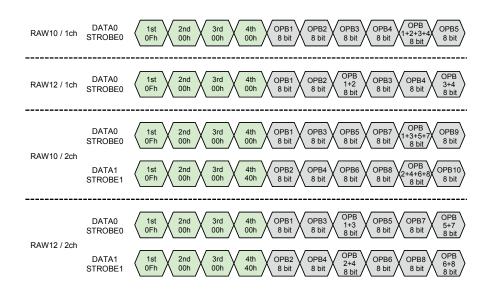

In serial LVDS output mode, the sync codes can be selected from sync code 1 that is output added to the effective signal line, and sync code 2 that are not added during the vertical blanking period. The figure below shows examples of the two sync code types. In addition, the sync codes are output in the order of 1st  $\rightarrow$  2nd  $\rightarrow$  3rd  $\rightarrow$  4th, and fixed values are output for the 1st to 3rd sync codes. (BLK: Blanking period)

8 bits of sync codes are added, from 1st to 4th, regardless of the number of output bits (10 bits or 12 bits). Codes supporting 1ch and 2ch are added in the 4th code and output. (See the figure below.)

List of Sync Code Setting Registers

R	egister de	etails		Initial	Setting	Function
Register name	ChipID	Address	Bit	value	value	Function
					E1h	In parallel CMOS output mode
SYNCCODE 02h	3Bh	[7:0]	E1h	91h	Operation using sync code 1 in serial LVDS output mode	
					D1h	Operation using sync code 2 in serial LVDS output mode

When outputting SOL (Code when starting an effective line)

Example of Sync Code Output

# **Image Data Output Format**

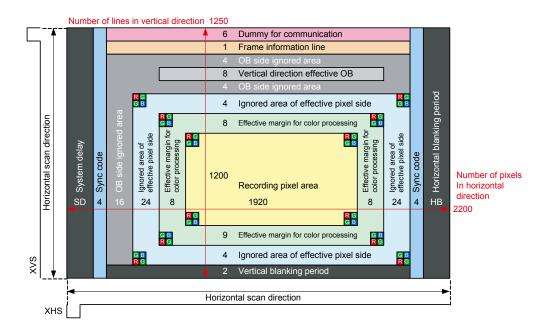

# All-pixel Scan Mode

The all pixel signals of sensor are read.

## HD720p mode

The sensor signal is cut out with the angle of view for HD720p (1280  $\times$  720) and read. However, set "1" to the register 720P MODE (Address 22h [7] ) Input 37.125 MHz to INCK.

## **Window Cropping Mode**

Sensor signals are cut out and read out in arbitrary positions.

Use a fixed window cropping size and position. When changing the size or the position, set via the all-pixel scan mode.

In addition, when returning to all-pixel scan mode after setting window cropping mode, return WINPH, WINPV, WINWH and WINWV to the initial values.

## List of Window Cropping Mode Setting Registers

## 2 x 2 Binning Readout Mode

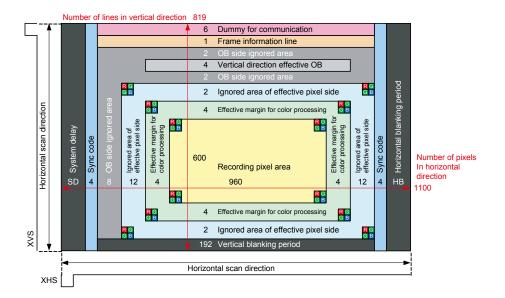

Sensor signals are read out by binning of 2 vertical pixels and 2 horizontal pixels.

Note) The pixel signals are A/D converted to 10 bits, and 12-bit output is performed by digital binning of 4 same-color pixels.

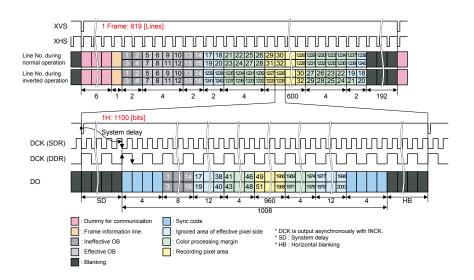

List of 2 × 2 Binning Readout Mode Setting Registers

Register details			Setting value

### **Description of Various Functions**

#### Standby mode

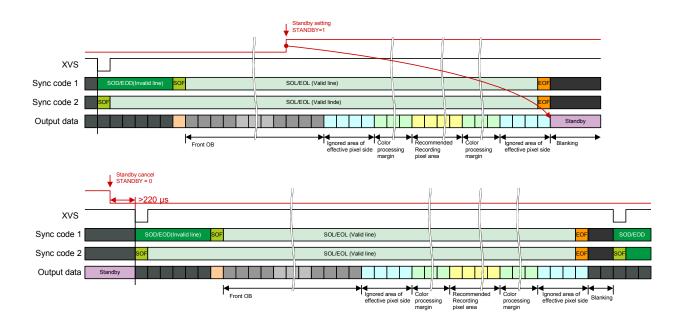

This sensor stops its operation and goes into standby mode which reduces the power consumption by writing "1" to the standby control register STANDBY (address 00h, Bit [0]). (Standby mode immediately after power-on and reset)

Standby mode is reflected after V. OB after the set frame.

Write to register is possible because the serial communication function operates even in standby mode. Set the STANDBY register to "0" to cancel standby mode. The standby cancel is immediately reflected from the communication.

### List of Standby Mode Setting

Register details			Initial	Setting	Sta	itus		
Register name	Address	Bit	value	value	Digital circuit	Analog circuit	Remarks	
STANDBY	00h	[0]	1	1 (Standby)	Stop	Stop	Register communication is	
	0011			0	Operate	Operate	executed even in standby mode.	

Standby Mode Change Timing

### **Slave Mode and Master Mode**

The sensor can be switched between slave mode and master mode. The switching is made by the XMASTER pin.

Set the XMSTA register (address 2Ch [0]) to "0" in order to start the operation after setting to master mode. In addition, set the count number of sync signal in vertical direction by the VMAX register (address 05h [7:0], 06h [7:0]) and the clock number in horizontal direction by the HMAX register (address 03h [7:0], 04h [5:0]). See the description of Operation Mode for details of drive mode.

### List of Slave and Master Mode Setting (e.g. All pixels 19.64 frame/s)

Pin name	Pin processing	Operation mode	Remarks	
XMASTER pin	Low fixed	Master Mode	High: 1.8 V Low: GND	
	High fixed	Slave Mode		

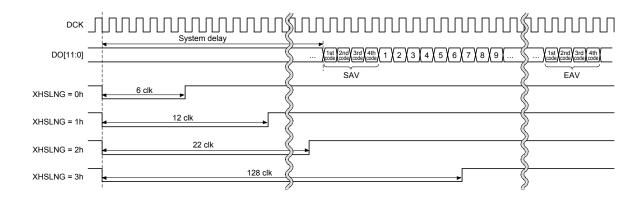

Description	Description of register			Setting	Status	Remarks		
Register name	Address	Bit	value	value	Master Mode	rtomante		
XMSTA	2Ch	[0]	1	0	Master operation start	The master operation		
AIVISTA	2011	[0]	ı	1	Master operation ready	starts by setting to 0.		
XHSLNG	21h	[5:4]	0		See the diagram.	XHS width designated (XVS reference output)		
XVSLNG	22h	[2:0]	0			XVS width designated		
VMAX	05h	[7:0]		4E2h	4E2b			Line number per frame
VIVIAX	06h	[7:0]	40211	S	ee the each item in	designated		
	03h	[7:0]	44Ch		Operation Mode.	Clock number per		
HMAX	04h	[5:0]	44CII			frame designated		

When a sensor is in slave mode, values set in the registers of the list above are invalid.

### **XHSLNG Selection**

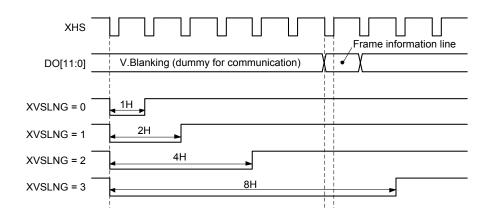

The signal of horizontal sync signal XHS is set by the XHSLNG register. The output has system delay from the XHS fall to effective data (sync code) output.

List of XHS Pulse Width Setting

### **XVSLNG Selection**

The signal of vertical sync signal XVS is set.

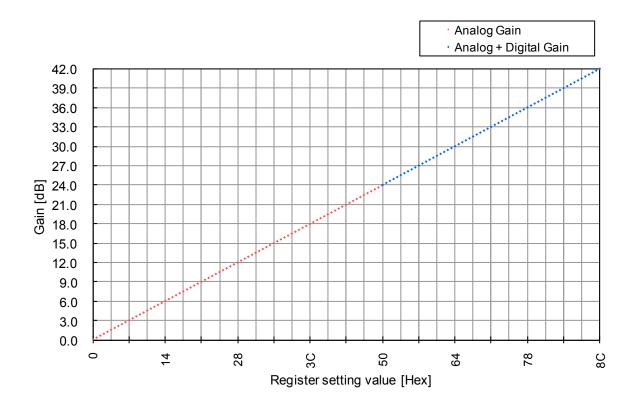

List of XVS Pulse Width Setting

## **Gain Adjustment Function**

The Programmable Gain Control (PGC) of this device consists of the analog block and digital block. The total of analog gain and digital gain can be set up to 42 dB by the GAIN register (address 1Eh [7:0]) setting.

See the List of Gain Setting Register Value for Each Register.

## **Black Level Adjustment Function**

The black level offset (offset variable range: 03Ch to 1FFh) can be added relative to the data in which the digital gain modulation was performed by the BLKLEVEL register (address: 20h [7:0], 21h [0]). When the BLKLEVEL setting is increased by 1 LSB, the black level is increased by 1 LSB.

Use with values shown below is recommended.

10-bit output: 3Ch (60d) 12-bit output: F0h (240d)

### List of Black Level Adjustment Register

BLKLEVEL	21h	[0]	USCII	USCII	

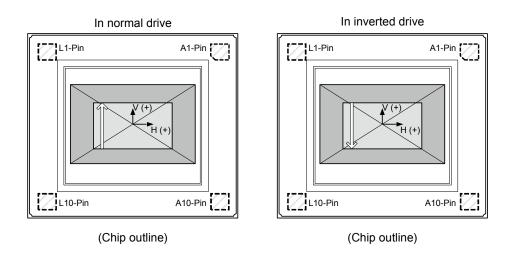

**SONY** IMX222LQJ-C

## **Vertical Normal Operation and Inverted Drive**

The sensor readout direction (normal/inverted) in vertical direction can be switched by the VREVERSE (address 01h [0]) register setting. See the item of "Drive mode" for the order of readout lines in normal and inverted modes. One invalid frame is generated when reading immediately after the readout direction change in order to switch the normal operation and inversion between frames.

### List of Vertical Drive Direction Setting Register

Register name	Address	Bit	illiliai value	Normal	Inverted
VREVERSE	01h	[0]	0	0	1

Normal and Inverted Drive Outline in Vertical Direction

### **Shutter and Integration Time Settings**

This sensor has a variable electronic shutter function that can control the integration time in line units. In addition, this sensor performs rolling shutter operation in which electronic shutter and readout operation are performed sequentially for each line.

Note) For integration time control, an image which reflects the setting is output from the frame after the setting changes.

## **Example of Integration Time Setting**

The sensor's integration time is obtained by the following formula.

Integration time = 1 frame period × (SVS + 1 - SPL) - (SHS1) × (1H period) - t<sub>OFFSET</sub> (However, SVS > SPL)

- Note) 1. The frame period is determined by the input XVS when the sensor is operating in slave mode, or the register VMAX value in master mode. The frame period is designated in 1H units, so the time is determined by (Number of lines × 1H period).
  - 2. See "Drive Modes" for the 1H period.
  - 3. t<sub>OFFSET</sub> is the integration time error. Substitute the value below in the formula of integration time.

Operation mode	t <sub>OFFSET</sub> [H]
All-pixel scan mode HD1080 p mode (10 bit-15 frame/s, 10 bit-30 frame/s, 12 bit-15 frame/s) Window cropping mode Vertical 1/2 subsampling mode	0.3
HD1080 p mode (12 bit 30 frame/s) 2 x 2 binning mode	0.1

In this item, the shutter operation and integration time are shown as in the figure below with the time sequence on the horizontal axis and the vertical address on the vertical axis. For simplification, shutter and readout operation are noted in line units.

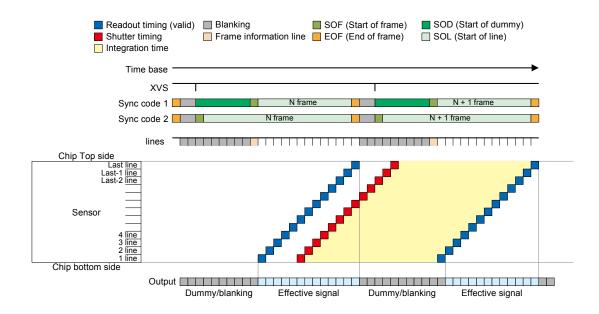

Image Drawing of Shutter Operation

# Normal Exposure Operation (Controlling the Integration Time in 1H Units)

The integration time can be controlled by varying the electronic shutter timing. In the electronic shutter settings, the integration time is controlled by the SHS1 register (address: 08h [7:0], 09h [7:0]).

Set SHS1 to a value between 0 and (Number of lines per frame - 1). When the sensor is operating in slave mode, the number of lines per frame is determined by the XVS interval (number of lines), using the input XHS interval as the line unit.

When the sensor is operating in master mode, the number of lines per frame is determined by the VMAX register (address: 05h [7:0], 06h [7:0]).

The number of lines per frame varies according to the drive mode.

## Registers Used to Set the Integration Time in 1H Units

Register details		Initial	Description			
Register name	Address	Bit	value	Description		
CHC1	08h	[7:0]	0000h	Sata the abuttar awarn time		
3131	SHS1 09h [7:0		000011	Sets the shutter sweep time.		
VMAX	05h	[7:0]	04506	Sets the number of lines per frame (only in master mode).		
VIVIAA	06h	[7:0]	04E2h	See "Operating Modes" for the setting value in each mode.		

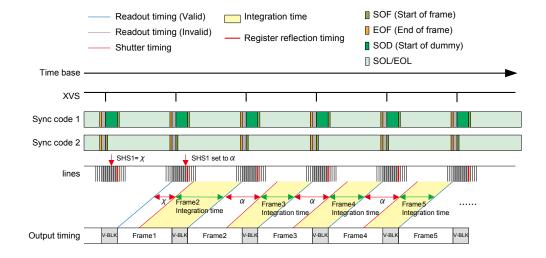

Image Drawing of Integration Time Control within a Frame

IMX222LQJ-C

## Long Exposure Operation (Control by Expanding the Number of Lines per Frame)

Long exposure operation can be performed by lengthening the frame period.

When the sensor is operating in slave mode, this is done by lengthening the input vertical sync signal (XVS) pulse interval.

When the sensor is operating in master mode, it is done by designating a larger register VMAX (address: 05h [7:0], 06h [7:0]) value compared to normal operation.

Likewise, in slave mode the integration time can be increased by lengthening the input XVS signal pulse interval. When the integration time is extended by increasing the number of lines, the rear V blanking increases by an equivalent amount.

The maximum VMAX and SHS1 values are 65535d. When the number of lines per frame is set to the maximum value, the integration time in all-pixel scan mode at 19.64 frame/s is approximately 2.7 s.

When set to a number of V lines or more than that noted for each readout drive mode, the imaging characteristics are not guaranteed during long exposure operation.

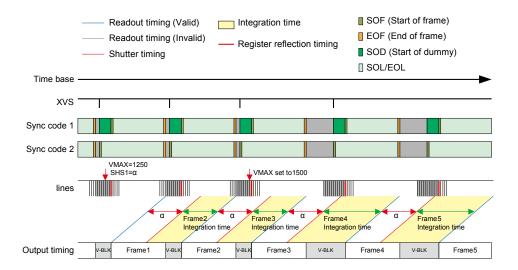

Image Drawing of Long Exposure Time Control by Adjusting the Frame Period

## Long Exposure Operation (Controlling the Integration Time in Frame Units)

When setting a long exposure that extends the integration time to one frame or more, set the SVS register (address: 0Fh [7:0], 10h [1:0]) to the value of (Number of integration frames - 1). In addition, the frame in which the shutter operates is designated by the SPL register (address: 0Dh [7:0], 0Eh [1:0]). To further adjust the integration time in 1H units within the frame set by SPL, set the SHS1 register. However, note that performing long integration causes the readout timing and the setting reflection timing to be eliminated according to the value set by SVS, so the frame rate drops. The blanking signal is output in data corresponding to the drop in the frame rate.

- ◆ This description is for the settings in master mode. In slave mode, long integration is set by eliminating the input vertical sync signal (XVS) pulse.
- ♦ When set so that SVS < SPL, the SPL setting value is ignored, and the signal is stored for the number of frames designated by SVS.</p>
- ◆ Set SHS1 to a value between 0 and (Number of lines per frame 7).
- During long exposure operation, register communication is also reflected at the eliminated timing. To forcibly end operation partway, use the shutter break function.
- ◆ The imaging characteristics are not guaranteed during long exposure operation that performs integration for 2 frames or more.

Register details		laitial value	5		
Register name	Address	Bit	Initial value	Description	
SSBRK	12h	[0]	1h	Shutter break function Set both SVS and SPL to "0" simultaneously with this setting.	
SVS	0Fh [7:0]		000h	Designates the number of integration frames.	
373	10h	[1:0]	00011	Integration time = Setting value + 1 frame	
SPL	0Dh	[7:0]	0006	Designates the number of augen frames	
SPL	0Eh	[1:0]	000h	Designates the number of sweep frames.	
	08h	[7:0]		Sets the shutter sweep time.	
SHS1	09h	[7:0]	0000h	Note) When SVS is set to more than 1h, SHS1 is limited to less than VMAX-7.	

<sup>\*</sup> Integration time control is reflected to the next readout frame after the frame during which the setting was made.

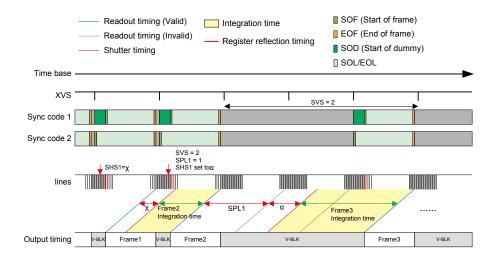

Image Drawing of Long Exposure Control in Frame Unit

# **Example of Integration Time Setting**

The example of register setting for controlling the integration time is shown below.

Example of Integration Time Setting (in all-pixel mode, t<sub>OFFSET</sub>=0.3H)

Operation	Ser	nsor setti	ng (Regis	ster)	Integration time	
Operation	VMAX*	SVS	SPL	SHS1	Integration time	
				1249	0.7H period	
				1248	1.7H period

		:			:	
Long-time exposure operation (integration time	1250			N	(12499.7 – N) H period	
control in frame units)	1250		1	IN	(11249.7 – N) H period	
		9	2		(9999.7 – N) H period	
		9	:		:	
			L		{VMAX × (10 − L) − N − 0.3} H period	
			:		:	
		V	L		$\{VMAX \times (V + 1 - L) - N - 0.3\} H period$	

<sup>\*</sup> In sensor master mode. XVS interval to be input in slave mode.

<sup>\*</sup> The SHS1 setting value (N) is set to the VMAX value (M) of -7 to 0.

IMX222LQJ-C

#### **Shutter Break Function**

When changing the integration time setting before the next reflection timing (readout timing) during long integration operation, the setting can be reflected at the normal XVS timing (when the register SVS is set to "0h") by setting the SSBRK register (address: 12h [0]) to "01h". The timing at which the SSBRK register is reflected conforms to the frame sequence before SVS is set.

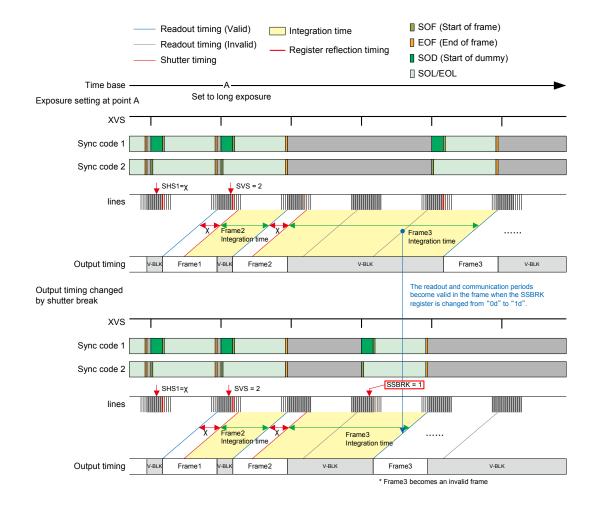

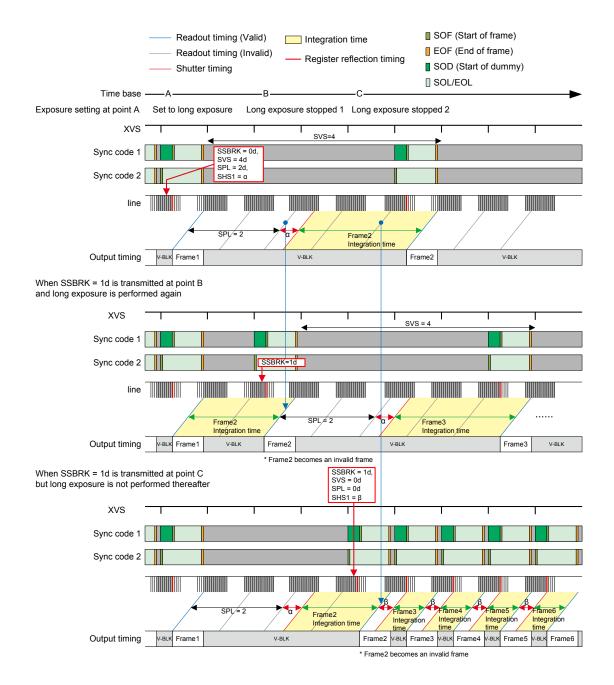

Image Drawing of Shutter Break Function

Depending on the value set when long integration operation starts (point "A" on the time base), the scheduled output can be stopped partway and settings can be changed as shown in the figure above. In this case, readout occurs in the frame when the SSBRK register is transmitted, and the signal stored up to that point is output. In this case the signal output in the frame when SSBRK is set becomes an invalid signal. In addition, perform communication at the next communication timing to return the SSBRK register to "0d".

Example Showing Application of the Shutter Break Function

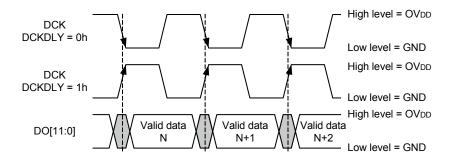

When the SVS and SPL register values are left unchanged after the shutter break, readout is performed and then long integration starts again. To stop long integration with shutter break, the SVS and SPL register values must both be set to "0d" during the communication period of the frame during which shutter break is performed.

**SONY** IMX222LQJ-C

## **Output Signal Interface Control**

This sensor supports the following output formats. See "Image Data Output Format" for the data rate. Shaded areas in the figure indicate invalid data with regards to the AC characteristics. See "AC Characteristics" for details.

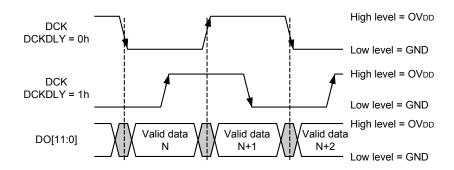

### **Parallel CMOS SDR Output**

Example of Pin Waveform in CMOS 1-port SDR Output Mode

The sensor signal is output in sync with the falling edge of the data clock (DCK). (When DCKDLY is set to "0h") Output in sync with the rising edge is possible by setting DCKDLY to "1h".

### **Parallel CMOS DDR Output**

Example of Pin Waveform in CMOS 1-port DDR Output Mode

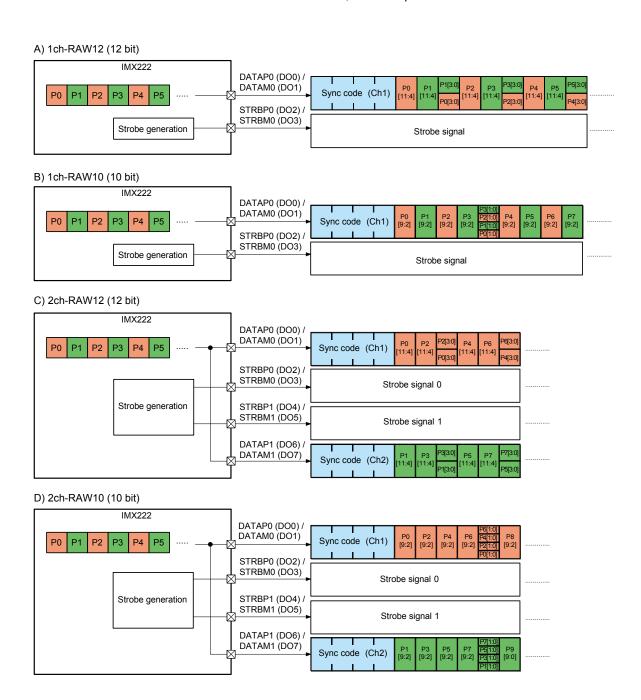

The sensor signal is output in sync with both rising and falling edges of the data clock (DCK). (When DCKDLY is set to "0h")

Output can be performed with the DCK phase shifted by 90° relative to the data by setting DCKDLY to "1h".

**SONY** IMX222LQJ-C

# **Serial LVDS Output**

Serial LVDS uses a different format depending on whether the output gradation is 10 bits or 12 bits. The data is divided into a DATA line and a STROBE line, and is output on 1 channel or divided into 2 channels.

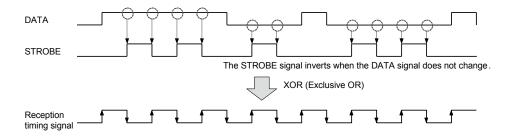

List of Serial LVDS Output Formats

IMX222LQJ-C

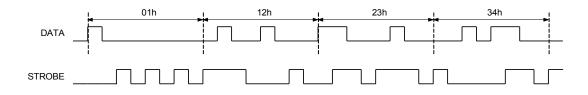

### **DATA-Strobe Method**

**DATA-Strobe Method** 

LVDS output uses the DATA-Strobe method. The DATA signal outputs the output data in binary format, but the STROBE signal performs toggle operation when the DATA signal does not change  $(0 \rightarrow 0, 1 \rightarrow 1)$ . The signal switching timing is obtained by taking the XOR (exclusive OR) of the DATA and STROBE signals. Data is output LSB first at both the rising and falling edges of the waveform obtained by the XOR operation.

Example: When outputting 01h, 12h, 23h and 34h in order

Output sequence

### **Output Formats and Setting Methods**

Register details		Initial Setting		Description	
Register name	Address	Bit	value	value	Description
				0	Parallel CMOS output, SDR output
OPORTSEL	11h	[4.2]		1	Parallel CMOS output, DDR output
OPORTSEL	1111	[4:3]	0	2	Serial LVDS 1ch output
				3	Serial LVDS 2ch output
ADRES 12h	F41	[1]	0	0	In parallel CMOS output mode: 10-bit output In serial LVDS output mode: 10-bit RAW10 output
	1211			1	In parallel CMOS output mode: 12-bit output In serial LVDS output mode: 12-bit RAW12 output
DOWNLY	ODI	r41		0	In CMOS SDR output mode: Output in sync with the falling edge In CMOS DDR output mode: Output in sync with the edge (0°) In LVDS output mode: Setting invalid
DCKDLY	2Dh [1]	[1] 0	1	In CMOS SDR output mode: Output in sync with the rising edge In CMOS DDR output mode: Output with the phase delayed by 90 ° In LVDS output mode: Setting invalid	

# **Output Signal Range**

The output gradation of this sensor can be switched to 10 bits or 12 bits. However, the output gradation is fixed for some drive modes.

In parallel CMOS output mode, the output 10 bits or 12 bits are assigned to 10 pins or 12 pins, respectively. When set to 10 bits, the data is output from DO11 to DO2, and the unused pins are fixed Low.

Bit Assignment for Each Output Gradation

DO nin	Output bit a	assignment	
DO pin	10 bit	12 bit	
DO [11]	DO [9]	DO [11]	
DO [10]	DO [8]	DO [10]	
DO [9]	DO [7]	DO [9]	
DO [8]	DO [6]	DO [8]	
DO [7]	DO [5]	DO [7]	
DO [6]	DO [4]	DO [6]	
DO [5]	DO [3]	DO [5]	
DO [4]	DO [2]	DO [4]	
DO [3]	DO [1]	DO [3]	
DO [2]	DO [0]	DO [2]	
DO [1]	Fixed to "0"	DO [1]	
DO [0]	Fixed to "0"	DO [0]	

In serial LVDS output mode, output uses the RAW10 format when the sensor gradation is 10 bits, or the RAW12 format when the sensor gradation is 12 bits.

→ RAW12 Format

→ RAW10 Format

Example of RAW12 and RAW10 Format Output

# **Output Range**

Output method	Output gradation	Output range			
Output method	Output gradation	Minimum value	Maximum value		
Parallel CMOS output	10 bit	000h	3FEh		
	12 bit	000h	FFEh		
Serial LVDS output	10 bit	004h	3FFh		
Seriai LVDS output	12 bit	010h	FFFh		

The range of the minimum and maximum values of the output data differs in parallel CMOS output mode and serial LVDS output mode. In parallel CMOS output mode, the output pins do not go to "All 1" except for the sync code. In serial LVDS output mode, the sensor signal may go to "All 1", but not to "All 0".

### **Mode Transitions**

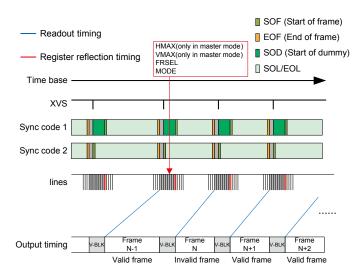

When changing the drive mode during sensor drive operation, first set the sensor to all-pixel scan mode, and then set it again to the desired drive mode. The table below shows the number of invalid frames generated by transition between the various modes.

Data is output from sensor during the invalid frame period, but the output values may not reflect the integration time or may not be uniform on the screen, or a partially saturated image may be output.

Number of Invalid Frames Generated during Mode Transitions

Мс	Number of invalid frames		
All-pixel scan mode	$\rightarrow$	Window cropping mode	
All-pixel scan mode	$\rightarrow$	2 × 2 binning mode	
All-pixel scan mode	$\rightarrow$	Vertical 1/2 subsampling mode	
All-pixel scan mode	$\rightarrow$	All-pixel scan mode, vertical value inversion	4
Window cropping mode	$\rightarrow$	All-pixel scan mode	
2 × 2 binning mode	$\rightarrow$	All-pixel scan mode	
Vertical 1/2 subsampling mode	$\rightarrow$	All-pixel scan mode	
All-pixel scan mode, vertical value inversion	$\rightarrow$	All-pixel scan mode	

Note) When transitioning from window cropping mode to all-pixel scan mode, return the cropping range setting registers WINWH and WINWV to the initial values (7C0h, 4C9h).

<sup>\*</sup>When changing the drive mode also changes the frame period, the number of invalid frames is counted according to the frame period after the change.

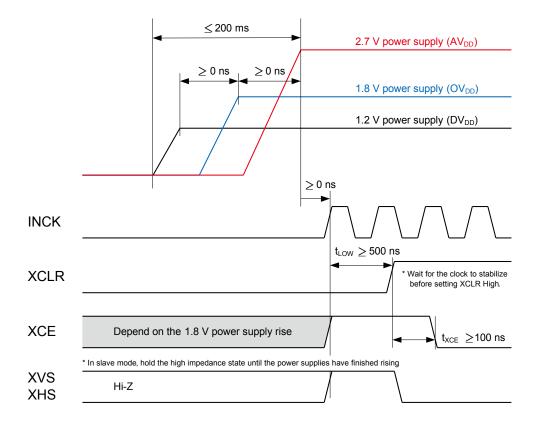

**Invalid Frame Generation Timing** 

## Power-on/off Sequence

### **Power-on Sequence**

Follow the sequence below to turn on the power supplies.

- Turn on the power supplies so that the power supplies rise in order of 1.2 V power supply (DV<sub>DD</sub>) →
   1.8 V power supply (OV<sub>DD</sub>) → 2.7 V power supply (AV<sub>DD</sub>). In addition, all power supplies should finish rising within 200 ms.
- 2. Start master clock (INCK) input after turning on the power supplies.
- 3. The register values are undefined immediately after power-on, so the system must be cleared. Hold XCLR at Low level for 500 ns or more after all the power supplies have finished rising. (The register values after a system clear are the default values.) In addition, hold XCE at High level during this period. The XCE rise timing differs according to the 1.8 V power supply (OV<sub>DD</sub>), so hold XCE at High level until INCK is input. The system clear is applied by setting XCLR to High level. However, the master clock needs to stabilize before setting the XCLR pin to High level.
- 4. Make the sensor settings by register communication after the system clear. A period of 100 ns or more should be provided after setting XCLR High before inputting the communication enable signal XCE.

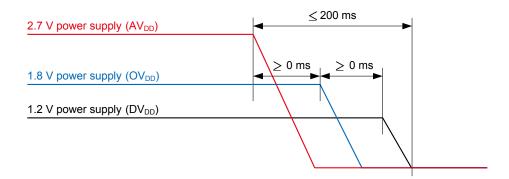

Power-on Sequence

IMX222LQJ-C

# **Power-off Sequence**

Turn Off the power supplies so that the power supplies fall in order of 2.7 V power supply (AV<sub>DD</sub>)  $\rightarrow$  1.8 V power supply (OV<sub>DD</sub>)  $\rightarrow$  1.2 V power supply (DV<sub>DD</sub>). In addition, all power supplies should finish falling within 200 ms. Set each digital input pin (INCK, XCE, SCK, SDI, XCLR, XMASTER, XVS, XHS) to 0 V or high impedance before the 1.8 V power supply (OV<sub>DD</sub>) falls.

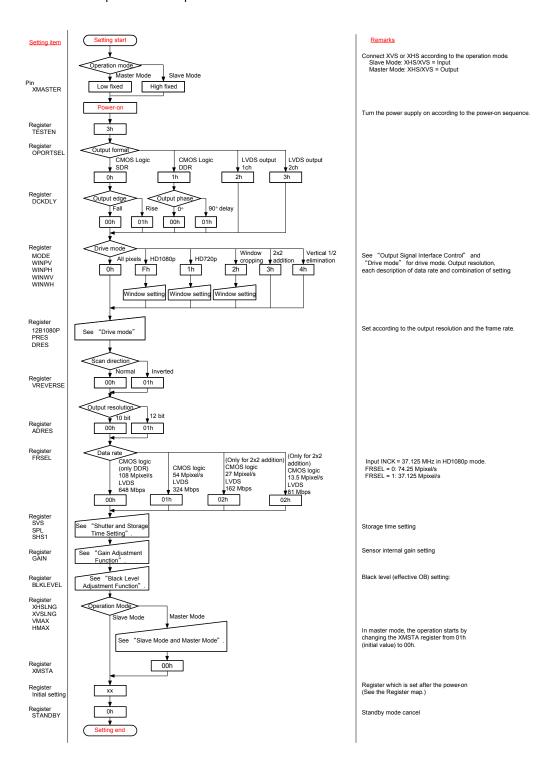

Power-off Sequence

**SONY** IMX222LQJ-C

# **Sensor Setting Flow Chart**

The initial setting flow chart of sensor is shown below. The initial setting should be made after the sensor reset immediately after the power-on.

See the items of the operation description shown in "Remarks" for control method.

IMX222LQJ-C

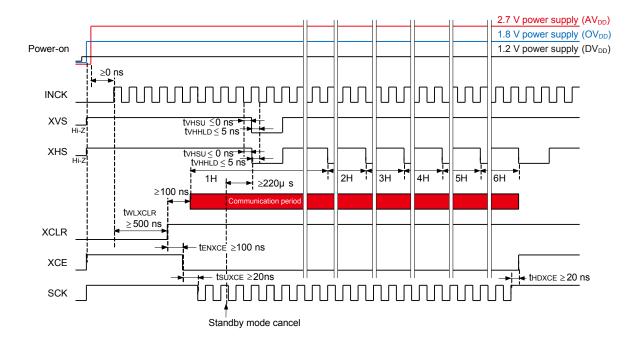

# **Serial Communication Period after Sensor Reset**

#### Slave mode

The communication period is set at the timing shown below for the sensor initial settings immediately after power-on. In slave mode, the vertical and horizontal sync signals (XVS, XHS) become valid only from the falling edges 100 ns or more after sensor reset (after XCLR is set Low). The 6H serial communication period is from the falling edge of the first valid XVS to the sixth XHS falling edge thereafter.

Note) XVS and XHS signals input when XCLR is Low are ignored. At this time the sensor is in standby mode until the next XVS signal. Register communication is possible in standby mode.

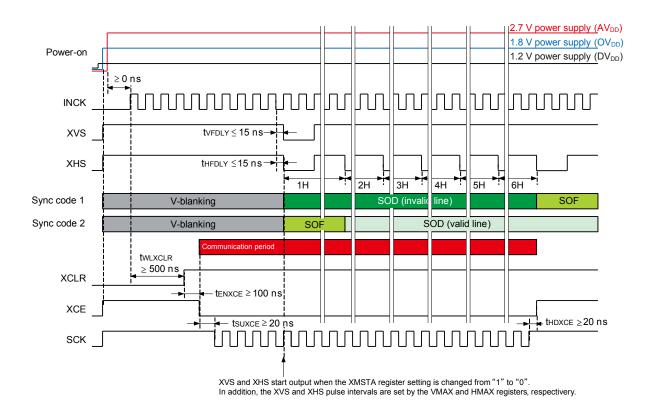

Communication Period after Sensor Reset in Slave Mode

#### Master mode

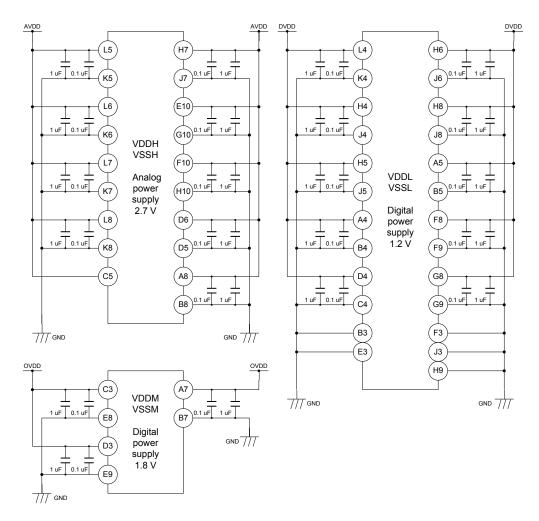

In master mode, the HMAX register (address 03h [7:0], 04h [5:0]) initial value is "44Ch" and the VMAX register (address 05h [7:0], 06h [7:0]) initial value is "4E2h", so both XVS and XHS are output at these initial setting V and H widths until the setting values are reflected 6H later. When the VMAX and HMAX registers are set to arbitrary values by serial communication at the initial setting, and the master mode start register XMSTA (address 2Ch [0]) setting is changed from "1" to "0", XVS and XHS start output according to the set values from the 7th H after the register settings are reflected. However, when VMAX and HMAX are set during the standby period, XVS and XHS are output according to the set values after standby is canceled.

Communication Period after Sensor Reset in Master Mode

# **Spot Pixel Specifications**

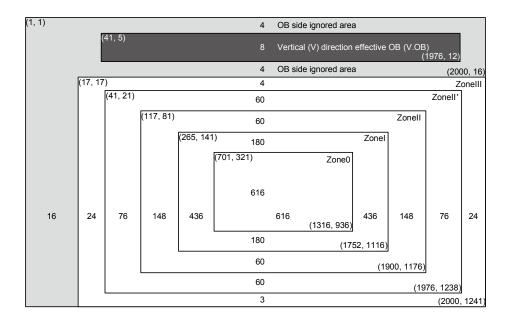

(AV<sub>DD</sub> = 2.7 V, OV<sub>DD</sub> = 1.8 V, DV<sub>DD</sub> = 1.2 V, Ta = 60 °C, 30 frame/s, Gain: 0 dB)

		Maximu	m distorted p	oixels i	in each zone	Measurement	
Type of distortion	Level	0 to II'	Effective OB	III	Ineffective OB	method	Remarks
Black or white pixels at high light	30 % ≤ D	17	No evaluation criteria applied		1		
White pixels in the dark	5.6 mV ≤ D	2	No evaluation criteria applied		2	Ta = 60 °C 1/30 s integration	
Black pixels at signal saturated	D ≤ 649 mV	0	No evaluation criteria applied		3		

Note) 1. Zone is specified based on all-pixel drive mode.

- 2. D...Spot pixel level.
- 3. See the Spot Pixel Pattern Specifications for the specifications in which white pixel and black pixel are close.

## **Zone Definition**

## **Notice on White Pixels Specifications**

After delivery inspection of CMOS image sensors, cosmic radiation may distort pixels of CMOS image sensors, and then distorted pixels may cause white point effects in dark signals in picture images. (Such white point effects shall be hereinafter referred to as "White Pixels".) Unfortunately, it is not possible with current scientific technology for CMOS image sensors to prevent such White Pixels. It is recommended that when you use CMOS image sensors, you should consider taking measures against such White Pixels, such as adoption of automatic compensation systems for White Pixels in dark signals and establishment of quality assurance standards. Unless the Seller's liability for White Pixels is otherwise set forth in an agreement between you and the Seller, Sony Corporation or its distributors (hereinafter collectively referred to as the "Seller") will, at the Seller's expense, replace such CMOS image sensors, in the event the CMOS image sensors delivered by the Seller are found to be to the Seller's satisfaction, to have over the allowable range of White Pixels as set forth as set forth above under the heading "Spot Pixels Specifications", within the period of three months after the delivery date of such CMOS image sensors from the Seller to you; provided that the Seller disclaims and will not assume any liability after if you have incorporated such CMOS image sensors into other products. Please be aware that Seller disclaims and will not assume any liability for (1) CMOS image sensors fabricated, altered or modified after delivery to you, (2) CMOS image sensors incorporated into other products, (3) CMOS image sensors shipped to a third party in any form whatsoever, or (4) CMOS image sensors delivered to you over three months ago. Except the above mentioned replacement by Seller, neither Sony Corporation nor its distributors will assume any liability for White Pixels. Please resolve any problem or trouble arising from or in connection with White Pixels at your costs and expenses.

#### [For Your Reference] The Occurrence Rate of White Pixels

The chart below shows the predictable data on the occurrence rates of White Pixels in a single-story building in Tokyo at an altitude of 0 meters. It is recommended that you should consider taking measures against White Pixels, such as adoption of automatic compensation systems appropriate for each occurrence rate of White Pixels.

The data in the chart is based on records of past field tests, and signifies estimated occurrence rates calculated according to structures and electrical properties of each device. Moreover, the data in the chart is for your reference purpose only, and is not to be used as part of any CMOS image sensor specifications.

#### **Example of Occurrence Rates**

White Pixel Level (in case of storage time = 1/30 s) (Ta = 60 °C)	Occurrence Rate per week
5.6 mV or higher	8.1 %
10.0 mV or higher	5.0 %
24.0 mV or higher	2.4 %
50.0 mV or higher	1.3 %
72.0 mV or higher	1.0 %

- Note 1) The above data indicates the average occurrence rate of a single White Pixels that will occur when a CMOS image sensor is left for a week.
  - For example, in a case of a device that has a 1 % occurrence rate per week at the 5.6 mV or higher effect level, this means that if 1,000 devices are left for a week, a total of 10 devices out of the whole 1,000 devices will have a single White Pixels at the 5.6 mV or higher effect level.
- Note 2) The occurrence rate of White Pixels fluctuates depending on the CMOS image sensor storage environment (such as altitude, geomagnetic latitude and building structure), time (solar activity effects) and so on. Moreover, there may be statistic errors. Please take notice and understand that this is an example of test data with experiments that have being conducted over a specific time period and in a specific environment.
- Note 3) This data does not guarantee the upper limits of the occurrence rate of White Pixels.

#### For Your Reference:

The occurrence rate of White Pixels at an altitude of 3,000 meters is from 5 to 10 times more than that at an altitude of 0 meters because of the density of the cosmic rays. In addition, in high latitude geographical areas such as London and New York, the density of cosmic rays increases due to a difference in the geomagnetic density, so the occurrence rate of White Pixels in such areas approximately doubles when compared with that in Tokyo.

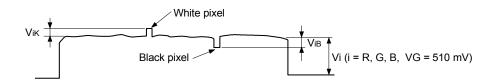

## **Measurement Method for Spot Pixels**

After setting the measurement condition to the standard imaging condition II, and the device drive conditions are within the bias and clock voltage conditions. Configure the drive circuit according to the example and measure.

# 1. Black or white pixels at high light

After adjusting the average value of the Gr/Gb signal output to 510 mV, measure the local dip point (black pixel at high light, ViB) and the peak point (white pixel at high light, ViK) in the Gr/Gb/R/B signal output Vi (i = Gr/Gb/R/B), and substitute the values into the following formula.

Spot pixel level D =  $\{(Vi_B \text{ or } Vi_K)/Vi \text{ average value}\} \times 100 [\%]$ 

Signal output waveform of R/G/B channel

# 2. White pixels in the dark

Set the device to a dark setting and measure the local peak point of the signal output waveform using the average value of the dark signal output as a reference.

## 3. Black pixels at signal saturated

Set the device to operate in saturation and measure the local dip point using the OB output as a reference.

Signal output waveform of R/G/B channel

# **Spot Pixel Pattern Specifications**

Spot pixel patterns are counted as shown below.

List of Spot Pixel Patterns

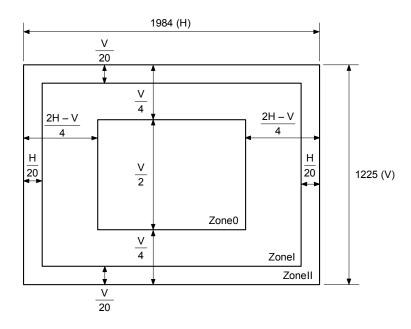

No.	Pattern	White pixel	Black pixel	Bright spot
1		Rejected	Rejected	Rejected
2		Rejected	Rejected	Rejected
3		Allowed	Allowed	Allowed
4		Rejected	Allowed	Allowed
5		Allowed	Allowed	Allowed

- Note) 1. ●: Black circles indicate the positions of spot pixels. The patterns are specified separately for white pixels, black pixels and bright spots.
  - (Example: Even when a black pixel and a white pixel are arranged as shown by pattern No. 1, this is not judged as a defect (Allowed).)
  - 2. Sensors exhibiting one or more patterns indicated as "Rejected" are sorted and removed.
  - 3. Sensors exhibiting patterns indicated as "Allowed" are not subject to sorting and removal, and these pixels are instead counted in the number of allowable spot pixels by zone.
  - 4. White pixels and black pixels other than the patterns noted in the table above are all counted in the number of allowable spot pixels by zone.

# **Stain Specifications**

Zone	Allowable pixels	Size	Level	Lens aperture	
0 to II	0	L≥3	R≥8%	F = 16	
Means no stain over three lines or more.					

### **Stain Zone Definition**

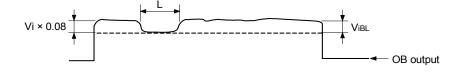

### **Stain Measurement Method**

In the following measurement, set the measurement condition to the standard imaging condition II, set the lens diaphragm to F16, and adjust the luminous intensity so that the average value of the G channel signal output is 150 mV. Measure the local dip in the average value of the R/G/B channel signal output (ViBL), and then calculate the stain level (R) as the ratio of ViBL to the average value of the R/G/B channel signal output (Vi).

Stain level R = 
$$(Vi_{BL}/Vi) \times 100 [\%]$$
 (i = R, G, B)

At the same time, the size (L) of the area where the stain level is 8 % or more is determined by line number conversion.

The distance from one center of a stain to another is the stain interval, and is also determined in the same way by line number conversion.

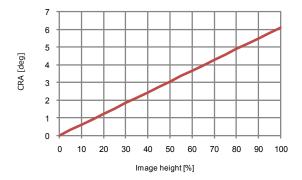

Signal output waveform of R/G/B channel

# **CRA Characteristics**

(Exit pupil distance: -30 mm)

The recommended CRA characteristics is 0.0 degrees all over the image height (0 - 100 %), because the target E.P.D. is infinite.

We assume that the worst case of E.P.D. is -30 mm. The CRA characteristics of -30 mm E.P.D. is described below. The real CRA should be smaller than the table below.

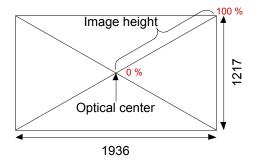

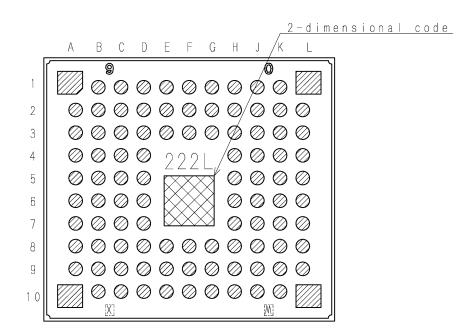

Image	CRA	
(%)	(mm)	(deg)
0	0.00	0.00
5	0.16	0.31
10	0.32	0.61
15	0.48	0.92
20	0.64	1.22
25	0.80	1.53
30	0.96	1.83
35	1.12	2.14
40	1.28	2.44
45	1.44	2.75
50	1.60	3.05
55	1.76	3.36
60	1.92	3.66
65	2.08	3.97
70	2.24	4.27
75	2.40	4.57
80	2.56	4.88
85	2.72	5.18
90	2.88	5.48
95	3.04	5.79
100	3.20	6.09

# Marking

Note: Following characters enter into "W", and "X".

W:In English upper case character, One character
X:Number, single number

DRAWING No. AM-C222LQJC(2D)

# **Notes On Handling**

#### 1. Static charge prevention

Image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- (1) Either handle bare handed or use non-chargeable gloves, clothes or material. Also use conductive shoes.
- (2) Use a wrist strap when handling directly.
- (3) Install grounded conductive mats on the floor and working table to prevent the generation of static electricity.
- (4) Ionized air is recommended for discharge when handling image sensors.
- (5) For the shipment of mounted boards, use boxes treated for the prevention of static charges.

#### 2. Protection from dust and dirt

Image sensors are packed and delivered with care taken to protect the element glass surfaces from harmful dust and dirt. Clean glass surfaces with the following operations as required before use.

- (1) Perform all lens assembly and other work in a clean environment (class 1000 or less).
- (2) Do not touch the glass surface with hand and make any object contact with it. If dust or other is stuck to a glass surface, blow it off with an air blower. (For dust stuck through static electricity, ionized air is recommended.)
- (3) Clean with a cotton swab with ethyl alcohol if grease stained. Be careful not to scratch the glass.
- (4) Keep in a dedicated case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- (5) When a protective tape is applied before shipping, remove the tape applied for electrostatic protection just before use. Do not reuse the tape.

#### 3. Installing (attaching)

- (1) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the bottom of the package. Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.
- (2) The adhesive may cause the marking on the rear surface to disappear.
- (3) If metal, etc., clash or rub against the package surface, the package may chip or fragment and generate dust.
- (4) Acrylate anaerobic adhesives are generally used to attach this product. In addition, cyanoacrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives to hold the product in place until the adhesive completely hardens. (reference)
- (5) Note that the sensor may be damaged when using ultraviolet ray and infrared ray on mounting it.

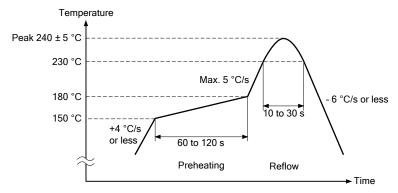

#### 4. Recommended reflow soldering conditions

The following items should be observed for reflow soldering.

(1) Temperature profile for reflow soldering

Control item	Profile (at part side surface)
1. Preheating	150 to 180 °C 60 to 120 s
2. Temperature up (down)	+4 °C/s or less (- 6 °C/s or less)
3. Reflow temperature	Over 230 °C 10 to 30 s Max. 5 °C/s
4. Peak temperature	Max. 240 ± 5 °C

#### (2) Reflow conditions

- (a) Make sure the temperature of the upper surface of the seal glass resin adhesive portion of the package does not exceed 245 °C.
- (b) Perform the reflow soldering only one time.
- (c) Finish reflow soldering within 72 h after unsealing the degassed packing. Store the products under the condition of temperature of 30 °C or less and humidity of 70 %RH or less after unsealing the package.
- (d) Perform re-baking only one time under the condition at 125  $^{\circ}\text{C}$  for 24 h.

#### (3) Others

- (a) Carry out evaluation for the solder joint reliability in your company.
- (b) After the reflow, the paste residue of protective tape may remain around the seal glass. (The paste residue of protective tape should be ignored except remarkable one.)
- (c) Note that X-ray inspection may damage characteristics of the sensor.

#### 5. Others

- (1) Do not expose to strong light (sun rays) for long periods, as the color filters of color devices will be discolored.
- (2) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or use in such conditions.
- (3) This product is precision optical parts, so care should be taken not to apply excessive mechanical shocks or force.
- (4) Note that imaging characteristics of the sensor may be affected when approaching strong electromagnetic wave or magnetic field during operation.
- (5) Note that image may be affected by the light leaked to optical black when using an infrared cut filter that has transparency in near infrared ray area during shooting subjects with high luminance.

# **Package Outline**

(Unit: mm)
